Q1) Graph (1)

Q2) Highlighting the differences from the graph

So the symbols I have used instead of ♦ and ♥ are @ and \$ respectively.

(0 , ^ , 9 , ^ , L) -> (0 , @ , 9 , @ , L)

(1 , ^ , 2 , ^ , R) -> (1 , @ , 2 , @ , R)

(2 , ^ , 7 , ^ , L) -> (2 , \$, 7 , \$, L)

(3 , ^ , 4 , ^ , R) -> (3 , \$, 4 , \$, R)

(5 , ^ , 6 , ^ , L) -> (5 , \$, 6 , \$, L)

(7 , ^ , 8 , ^ , L) -> (7 , @ , 8 , @ , L)

Q3) Formal definition of the proposed graph

States = {q0, q1, q2, q3, q4, q5, q6, q7, q8, q9, q10}

Symbol = {^, 1, @, \$}

Start State = Lowest number state = q0

Initial State	Current Symbol	New State	New Symbol	Move
Mex q0	@	q9	@	L
Mex q0	1	q1	^	R
Mex q1	@	q2	@	R
Mex q1	1	q1	1	R
Mex q2	\$	q7	b	L
Mex q2	1	q3	^	R
Mex q3	\$	q4	\$	R
Mex q3	1	q3	1	R
Mex q4	^	q5	1	L
Mex q4	1	q4	1	R
Mex q5	\$	q6	\$	L
Mex q5	1	q5	1	L
Mex q6	^	q2	1	R
Mex q6	1	q6	1	L
Mex q7	@	q8	@	L
Mex q7	1	q7	1	L

Mex q8	\wedge	q0	1	R
Mex q8	1	q8	1	L
Mex q9	\wedge	q10	\wedge	R
Mex q9	1	q9	1	L

Q4) Logic of the proposed graph

States = {q0, q1, q2, q3, q4, q5, q6, q7, q8, q9, q10}

1) First we initialize at q0 (starting state)

The machine starts up at 'q0', which is the initial state.

In the tape if '@' appears, it shifts to 'q1', updating for '^', and then to the right.

2) Numbers Processed (q1 & q2)

q1:

Shifts to 'q3', keeping the blank and moves to right, if '^' is encountered.

If '1' is seen, it moves to 'q2', updating '1' for blank and moves to the left.

q2:

Follows a loop in 'q2' but if '1' is detected, it moves left.

If '^' is detected, it moves to the right and remains at 'q2'.

3) Second Symbol Sequence

At q3:

If it detects '1', it moves right in a loop.

If it detects '\$' it moves right to 'q4'.

At q4:

If it detects '1', it moves to the right and goes back to 'q1'.

4) Retracing & Adapting

At q5:

If it detects '^', it moves left and updates to '1'.

If it detects 'b', it moves left to 'q6'.

At q6:

If it detects '1', it moves left and loops.

At q7:

If it detects 'b' or '1', it moves left and loops.

At q8:

If it detects 'a' or '1', it moves left and loops.

5) Taking in the input

At q9:

If it detects '^', it moves right to 'q10'.

The machine stops when it reaches the acceptable state 'q10'.

Q6 Machine code

a) 0 and 3 representation

b) 2 and 0 representation
(First 15 steps)

0

	^	1	1	@	\$	^	^	^	^	^	^	^

Q7 Graph and JSON (2)

Graph:

Explanation:

The turing machine takes input 'n' number in unary and returns 'n', 'n2' and 'n3' as the outputs, separated by A and B.

Symbols used:

A -> separator between 'n' and 'n2'.

B -> separator between 'n2' and 'n3'.

C -> a marker used temporarily for easier and faster copying.

Main steps:

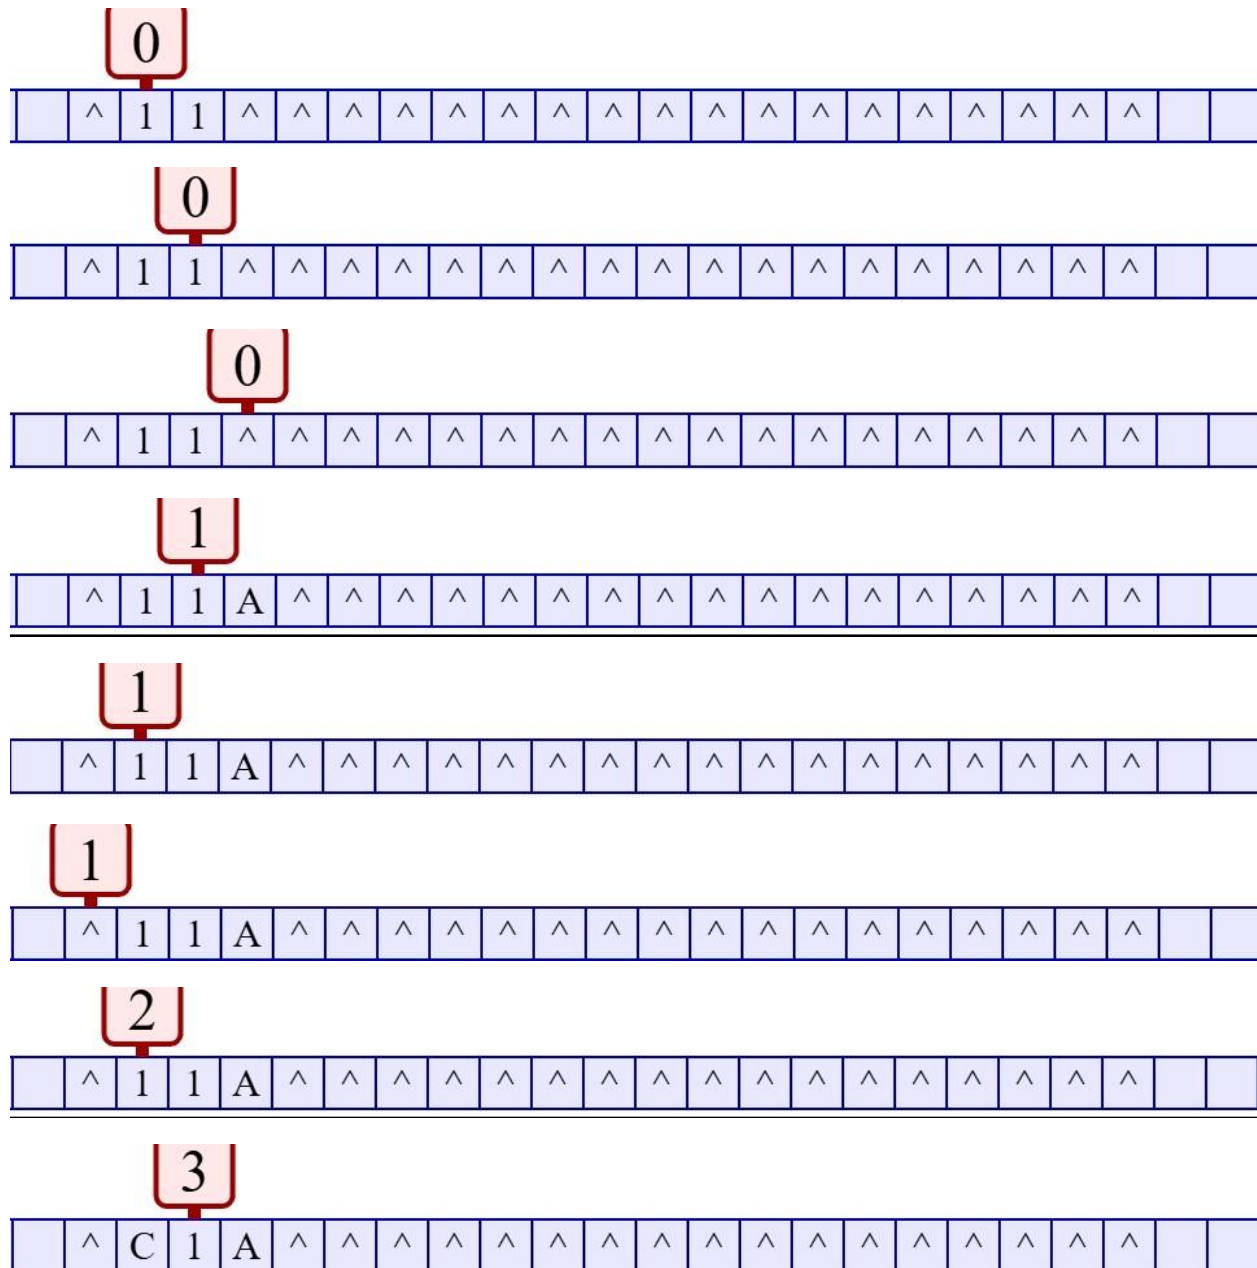

It duplicates 'n' and inserts 'A' as a separator.

Then computes 'n2' using the multiplication method and separates using 'B'.

Finally it computes 'n3' by multiplying 'n2' and 'n'.

Final Output : 11A1111B11111111

(First 15 steps)

[illegible][illegible][illegible][illegible][illegible][illegible][illegible]

Diagram illustrating the evolution of a 20-cell array over 17 steps. The array contains symbols: ^, 1, A, B, and empty cells. A red bracket above the array indicates the number of non-empty cells at each step.

- Step 13: 13 non-empty cells.
- Step 14: 14 non-empty cells.
- Step 10: 10 non-empty cells.
- Step 15: 15 non-empty cells.
- Step 15: 15 non-empty cells.
- Step 15: 15 non-empty cells.
- Step 15: 15 non-empty cells.
- Step 16: 16 non-empty cells.
- Step 17: 17 non-empty cells.
